# GRC : Scope covered by such solutions

**Imagine this as a real-time scenario:**

Your phone just received an alert. You click into the corporate app, use an iris scan and code authentication to gain secure mobile access, and immediately receive a recommendation to “update a specific section of the company’s T&E policy with a new rule and release it to employees in the whole country’s divisions before Friday.”

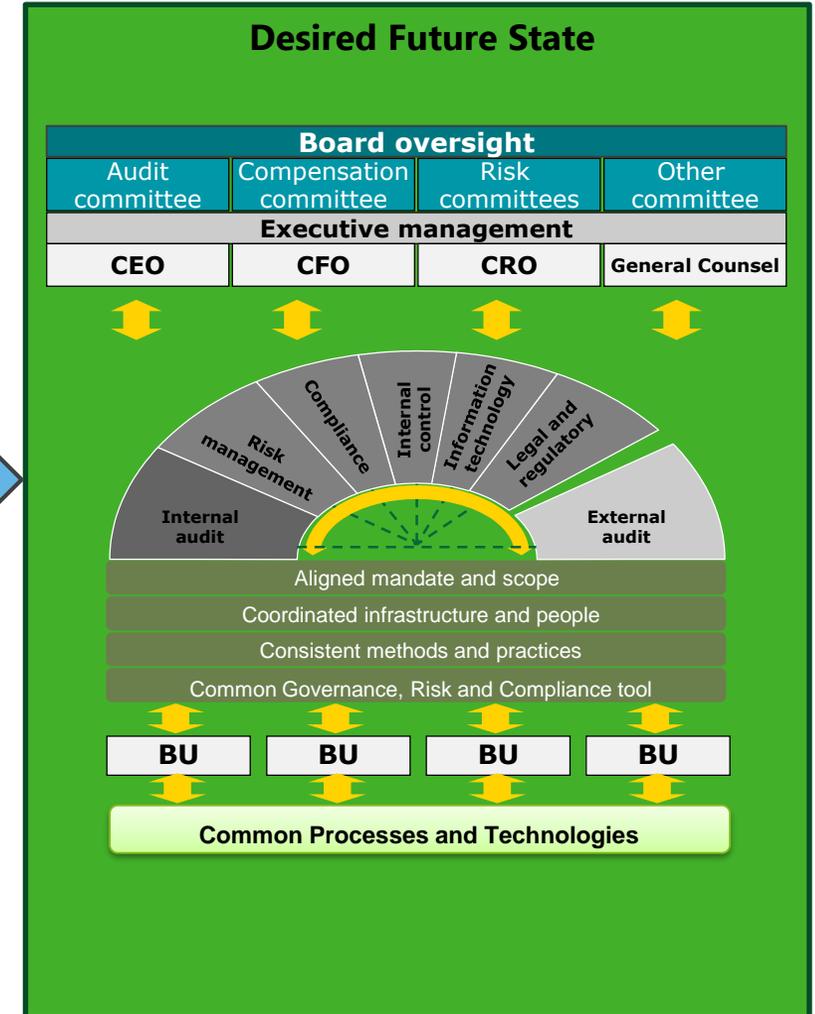

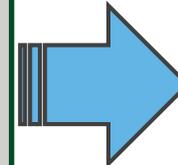

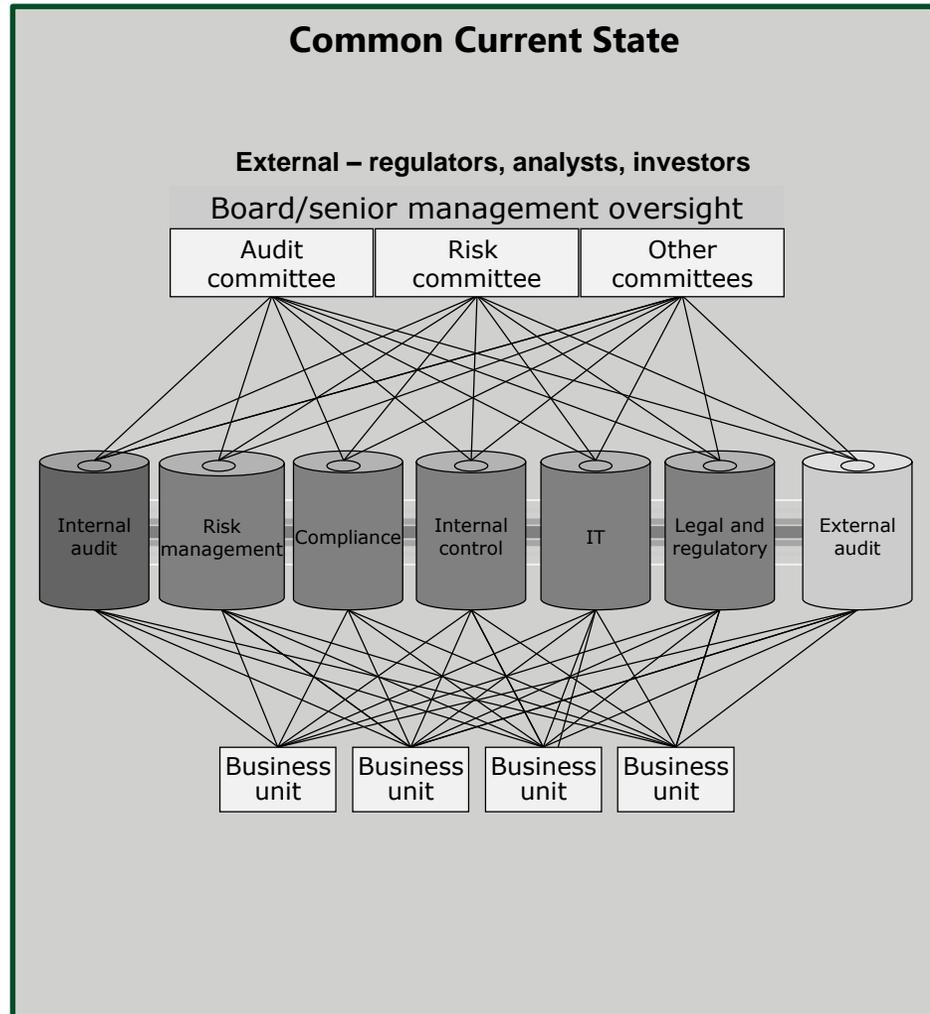

There’s a dashboard on your screen, and a flashing node indicates a new series of anti-bribery rules were released, effective six months from now. The red color indicates that control weaknesses noted in that region for areas designed to mitigate risk of Foreign Corrupt Practices Act (FCPA) violations. Your behavioral science analysis tool homes in on conduct pattern anomalies on a particular sales team. Swiping left shows related news stories-examples of other companies that have been fined for similar infractions dealing with like counterparties.

From the time you got the alert, you haven’t moved from your chair. But moments later, now that you’re informed, you have a plan to act.

# GRC : Convergence of Risk Functions

## Transformation from siloed into integrated approach

- Most companies have take a very siloed approach to risk management which creates multiple redundancies and extensive inconsistency in how risks are assessed and managed.
- An effective GRC program will aggregate the evaluation of risks and controls to create a convergence of Risk Management activities which results in greater consistency and efficiency across the GRC program and the company as a whole.
