Within the framework of inspections, you can create photos, videos, AI scanning of documents, fill out configurable forms on the server - fillable text and information fields, selectors with a search and a drop-down list of values, check boxes, radio buttons with a choice of values, repetition of steps and inspection processes.

Check-Up Online

Business and operating activities inspection

Check-Up Online
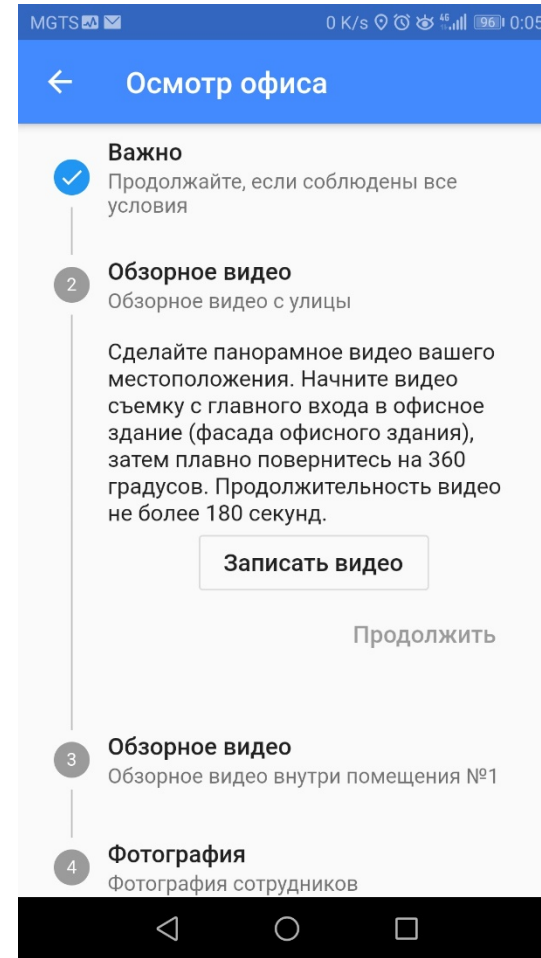

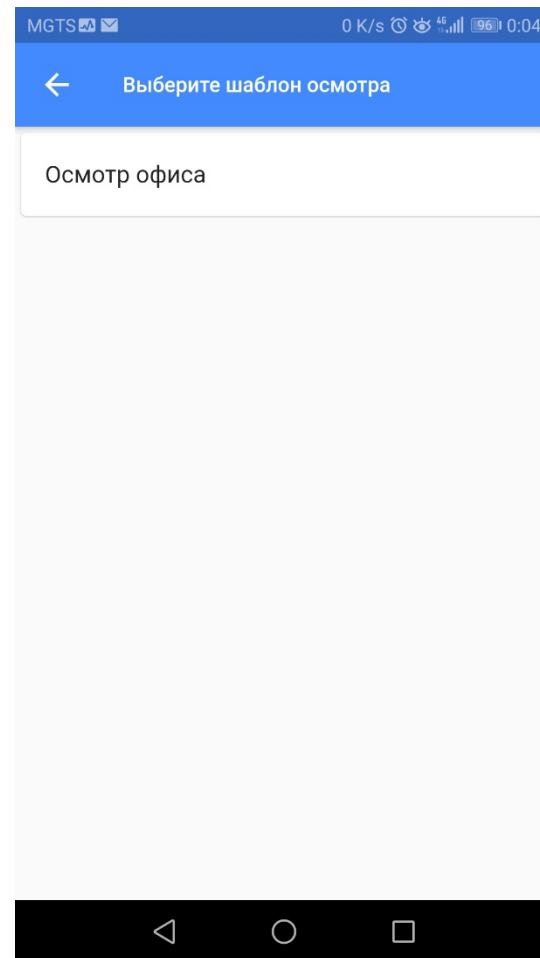

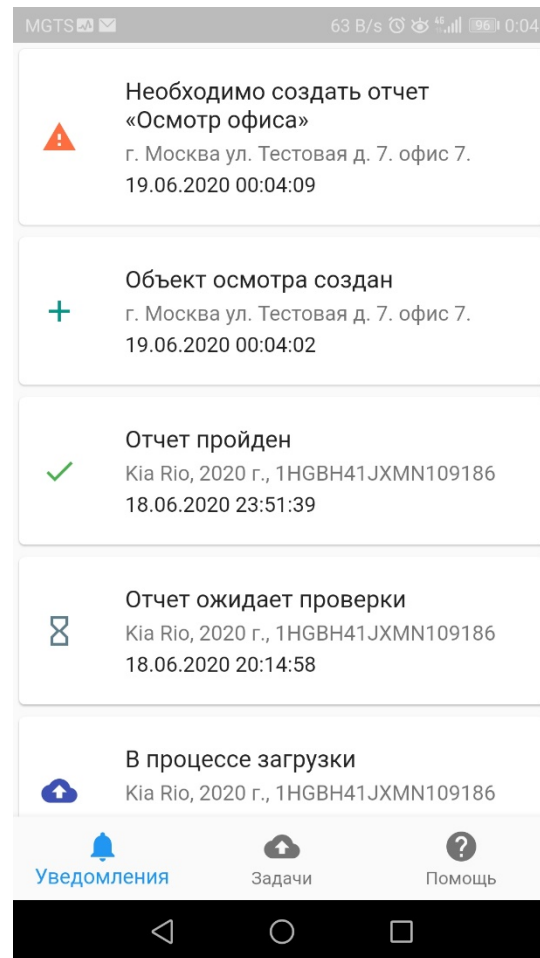

Functional clusters for banks

- Remote inspection of the property before processing credit and leasing documentation An effective tool that allows you to get a high-quality and objective view of a potential collateral or leased asset.

- Visual control and verification of the process of processing credit or leasing documents, incl. before transferring funds to the seller when registering an auto loan or leasing transaction.

- Remote visual fixation of signing of surety agreements and identification of signers, incl. for use as an additional evidence base.

- Standardization of the inspection process carried out by employees of a bank, leasing company or surveyors, assistance in visual inspection of the business of corporate borrowers.

- Objective assessment of the condition of the pledged object at the time of seizure and remote inspection of the seized by the appraisers according to the appraisal company's templates.

Check-Up Online

Functional clusters for insurance company

- Remote inspections for online sale of insurance products.

- Monitoring the conditions of insurance objects.

- Online damage settlement

Impressive functionality

For administrator

Objects constructor

You can create any types of inspection objects in the constructor without involving developers - cars, special equipment, real estate, business inspection, documents, etc.

Inspection constructor

Create any inspection scenarios in the constructor with text and photo instructions that are intuitive for the user of the mobile application.

Flexibility

Customize each step of the inspection - the required step, permission to create multiple media files within a step, permission to add a new step, and others.

.

Information security (Cyber-security):

- The software package can be deployed in the cloud (Saas), or on the client's own equipment (surrounded by a financial institution).

- For each client, we deploy a personal software package (hereinafter referred to as the PC) in a separate server directory, all processing server files and media files are stored in this directory. Each individual PC does not affect or interact with other deployed PCs.

Impressive functionality

For administrator

Inspection templates

Use private and public inspection templates. The private template becomes available to the user of the mobile application only after setting the task for inspection.

Target-setting

The user of the mobile application can initiate an inspection himself from the available templates, or the administrator can set a task to pass the inspection.

Feedback

Submit non-descriptive steps for revision, adding instructions and comments to them.

Information security (cyber-security) . For each client, we create a separate PC database, isolated from the databases of other clients, which excludes unauthorized access to the data of other PCs.

Impressive functionality

for mobile application users

Intuitively clear interface	Notices and instructions	Ability to leave comments on photos and videos
Preview of media files before uploading	Ability to add, skip steps and leave comments	A set of options for interaction with the administrator
